

Ear Acupuncture Map of the Horse

Dr. med vet Uwe Petermann, prakt Tierarzt, Akupunktur, Germany
e mail: DrUwePetermannMelle@t-online.de

Summary

At 3 horses the orthopedic localizations at the ear were verified independently with the help of the double laser technology of the controlled Acupuncture. One by one all joints were irradiated therapeutically with the laser. Nogier frequency C was used. A second laser was used to find out the appropriate points of resonance at the ear. This happened under RAC check.

Identical points were found on each single horse. The possibility of the lameness diagnostic over the ear-acupuncture-points is explained. A 10-years-experience in handling this method is present.

Keywords: Ear acupuncture, horse, laser, lameness diagnostic.

Introduction

Orthopedic diagnostics on animals are more difficult than on humans, the doctor has no information about place, severity level of the pain, and above all he has no information which special movement causes the pain-reaction in which place of the body. The veterinary merely can see, on which foot the animal has the lameness. Further, he can try to provoke a pain or reaction e.g. by stretching, bending or

palpating of the leg. In this way, he can draw conclusions on the point of the lameness. Finally, the point of the lameness can be limited by joint or line anaesthesias on a certain section. The following Roentgen diagnostics is only limited by one's fantasy, especially if it is done without the time-consuming anaesthesias. Through this, the place for the local therapy is often chosen wrong. Controlled Acupuncture could offer valuable diagnostic assistance, if an ear card with accurate orthopedic point localizations is available. So the ear-acupuncture-card in the veterinary medicine has not only therapeutic but also an important diagnostic meaning. Different authors created ear cards of some animal species in the passed years. The points of ear with electrical point detecting devices were in most cases found with well-known orthopedic pain localizations or by pain provocation tests.

Methodology

The ear card created here was developed with the help of the double laser technology under RAC/VAS check at 3 horses. For the researches 3 attained full growth, healthy warm blood horses were available. With the double-laser-technique the hinge points, spinal column and the single teeth in the upper and lower jaw of all 3 horses were treated with a 90watts pulsed laser. (Multimed, company Reimers and Janssen, D 10178 Berlin, Neue Schönheuser Str. 8). At the same time the ear is diagnostically searched for resonance with 2nd pulsed laser.

A corresponding point at the ear was clearly found for each point at the body. All points were marked at the ear and at the same time drawn to an ear card. In the same method the points were determined at the two other horses and compared together afterwards.

Result

The RAC/VAS Rebounds at the ear were to be found very exactly and clearly. A complete correspondence of the determined ear localisation could be seen. In the meantime an approximately 10-years-experience in handling with the ear acupuncture with hundreds of lameness diagnostics is existing. Nowadays, the high reliability of the method in most cases is the reason why diagnostic injections with the lameness diagnostics are performed by myself very rarely in the last years.
